Outline

Question

Papoulis Chapter 8, Question 6

Consider a random variable x with density $f(x) = xe^{-x}U(x)$. Predict with 95% confidence that the next value of x will be in the interval (a, b). Show that the length $b - a$ of this interval is minimum if a and b are such that

$$f(a) = f(b) \qquad \Pr(a < x < b) = 0.95 \tag{1.0.1}$$

Find a and b.

Solution

We shall show that if $f(x)$ is a density with a single maximum and $\Pr(axb) = \gamma$, the $b - a$ is minimum if $f(a) = f(b)$. The density $xe^{-x}U(x)$ is a special case. It suffices to show that $b - a$ is not minimum if $f(a) < f(b)$ or $f(a) > f(b)$.

Case 1: $f(a) > f(b)$

We can clearly see that $f'(a) > 0$ and $f'(b) < 0$, hence we can find two constants $\delta_1 > 0$ and $\delta_2 > 0$ such that $\Pr(a + \delta_1 < x < \delta_2) = \gamma$ and $f(a) < f(a + \delta_1) < f(b + \delta_2) < f(b)$.
We know that $\delta_1 > \delta_2$. Hence, the length of the new interval $(a + \delta_1, b + \delta_2)$ is $b - a + (\delta_2 - \delta_1)$ smaller than $b - a$.

Case 2: $f(a) < f(b)$

Here, we can form the interval $(a - \delta_1, b - \delta_2)$. Then the length of the interval becomes $b - a + (\delta_1 - \delta_2)$. Since $\delta_1 < \delta_2$, the length is less than $b - a$.
Hence for $f(a) < f(b)$ or $f(a) > f(b)$, the interval length is greater then $b - a$. Therefore the length of $b - a$ is minimum iff $f(a) = f(b)$.

Special case

$$f(x) = xe^{-x} \tag{2.0.1}$$

$$\implies F(x) = 1 - e^{-x} - xe^{-x}. \tag{2.0.2}$$

$$\implies \Pr(a < x < b) = e^{-a} + ae^{-a} - e^{-b} - be^{-b} = 0.95 \tag{2.0.3}$$

$$\tag{2.0.4}$$

S

ince f(a) = f(b),

$$ae^{-a} = be^{-b} \tag{2.0.5}$$

$$\implies \Pr\left(a < x < b\right) = e^{-a} - e^{-b} = 0.95 \tag{2.0.6}$$

$$\implies a = 0.04 and b = 4.75 \implies interval = 4.71 \tag{2.0.7}$$

If we set

$$0.025 = \Pr\left(x \le a\right) = F(a) \quad 0.025 = \Pr\left(x > b\right) = 1 - F(b) \tag{2.0.8}$$

$$0.025 = 1 - e^{-a} - ae^{-a} \quad 0.025 = e^{-b} + be^{-b} \tag{2.0.9}$$

$$a = 0.242, b = 5.572 \tag{2.0.10}$$

$$interval = 5.33 \tag{2.0.11}$$

Hence proved a special case also.
